

EMPIRICAL FORMULA and HYDRATES

- 1) A hydrate of magnesium sulfate has a mass of 13.52 g. This sample is heated until no water remains. The MgSO_4 anhydrate has a mass of 6.6 g. Find the formula and name of the hydrate.
- 2) To drive off the water, a 15.67 g sample of a hydrate of magnesium carbonate was heated without decomposing the carbonate. The mass was reduced to 7.58 g. What is the formula of the hydrate?
- 3) A sample of copper (II) sulfate hydrate has a mass of 3.97 g. After heating, the CuSO_4 that remains has a mass of 2.54 g. Determine the correct formula and name the hydrate.
- 4) A hydrate of Na_2CO_3 has a mass of 4.31 g before heating. After heating, the mass of the anhydrous compound is found to be 3.22 g. Determine the formula of the hydrate and then write out the name of the hydrate.

EMPIRICAL FORMULA and HYDRATES

Answers

- 1) A hydrate of magnesium sulfate has a mass of 13.52 g. This sample is heated until no water remains. The MgSO_4 anhydrate has a mass of 6.6 g. Find the formula and name of the hydrate.

$$\text{Mass of MgSO}_4 \cdot x\text{H}_2\text{O} = 13.52 \text{ g} \quad \text{Mass of MgSO}_4 = 6.6 \text{ g}$$

$$\text{Mass of H}_2\text{O} = 13.52 \text{ g} - 6.6 \text{ g} = 6.92 \text{ g}$$

$$\text{Moles of MgSO}_4 = 6.6 \text{ g} / 120.4 \text{ g/mol} = 0.0548 \text{ mol} / 0.0548 \text{ mol} = 1$$

$$\text{Moles of H}_2\text{O} = 6.92 / 18.015 \text{ g/mol} = 0.384 \text{ mol} / 0.0548 \text{ mol} = 7$$

The formula is $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$, and the name is magnesium sulfate heptahydrate.

- 2) To drive off the water, a 15.67 g sample of a hydrate of magnesium carbonate was heated without decomposing the carbonate. The mass was reduced to 7.58 g. What is the formula of the hydrate?

$$\text{Mass of MgCO}_3 \cdot x\text{H}_2\text{O} = 15.67 \text{ g} \quad \text{Mass of MgCO}_3 = 7.58 \text{ g}$$

$$\text{Mass of H}_2\text{O} = 15.67 \text{ g} - 7.58 \text{ g} = 8.09 \text{ g}$$

$$\text{Moles of MgCO}_3 = 7.58 \text{ g} / 84.313 \text{ g/mol} = 0.0899 \text{ mol} / 0.0899 \text{ mol} = 1$$

$$\text{Moles of H}_2\text{O} = 8.09 / 18.015 \text{ g/mol} = 0.449 \text{ mol} / 0.0899 \text{ mol} = 5$$

The formula is $\text{MgCO}_3 \cdot 5\text{H}_2\text{O}$.

- 3) A sample of copper (II) sulfate hydrate has a mass of 3.97 g. After heating, the CuSO_4 that remains has a mass of 2.54 g. Determine the correct formula and name the hydrate.

$$\text{Mass of CuSO}_4 \cdot x\text{H}_2\text{O} = 3.97 \text{ g} \quad \text{Mass of CuSO}_4 = 2.54 \text{ g} \quad \text{Mass of H}_2\text{O} = 3.97 \text{ g} - 2.54 \text{ g} = 1.43 \text{ g}$$

$$\text{Moles of CuSO}_4 = 2.54 \text{ g} / 159.6 \text{ g/mol} = 0.0159 \text{ mol} / 0.0159 \text{ mol} = 1$$

$$\text{Moles of H}_2\text{O} = 1.43 / 18.015 \text{ g/mol} = 0.0794 \text{ mol} / 0.0159 \text{ mol} = 5$$

The formula is $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, and the name is copper (II) sulfate pentahydrate.

- 4) A hydrate of Na_2CO_3 has a mass of 4.31 g before heating. After heating, the mass of the anhydrous compound is found to be 3.22 g. Determine the formula of the hydrate and then write out the name of the hydrate.

$$\text{Mass of Na}_2\text{CO}_3 \cdot x\text{H}_2\text{O} = 4.31 \text{ g} \quad \text{Mass of Na}_2\text{CO}_3 = 3.22 \text{ g}$$

$$\text{Mass of H}_2\text{O} = 4.31 \text{ g} - 3.22 \text{ g} = 1.09 \text{ g}$$

$$\text{Moles of Na}_2\text{CO}_3 = 3.22 \text{ g} / 105.988 \text{ g/mol} = 0.0304 \text{ mol} / 0.0304 \text{ mol} = 1$$

$$\text{Moles of H}_2\text{O} = 1.09 / 18.015 \text{ g/mol} = 0.0605 \text{ mol} / 0.0304 \text{ mol} = 2$$

The formula is $\text{Na}_2\text{CO}_3 \cdot 2\text{H}_2\text{O}$, and the name is sodium carbonate dihydrate
