PHYSICAL CHANGE WORKSHEET

Answers

1. What is a physical change?

A physical change is a usually reversible change in the physical properties of matter, such as size or shape, but does not change the matter itself.

2. Give examples of physical changes.

Some examples of physical changes:

a. Water changing various states of matter. For instance, ice melts into water, and water boils and evaporates to steam

b. Mixing substances without them reacting. For example, mixing salt and water is a physical change as the components can be separated.
